

For immediate release - January 2017

The Speedster and the Fastback, (both Patent Pending Products) will take any mechanics, Professional or Enthusiasts "where no one has gone before" ...Over floor grates, air hoses, and even unpaved driveways!

But more importantly, they both provides the mechanics incredible handling control for an ideal working position without having to pull himself by grabbing the vehicle being worked on.

The secret? Two 7" wheels in a "positive camber" configuration provides the capability to spin on a dime. By repositioning those wheels at "waist level", the Speedster controls like no other creeper. Many will say that "it doesn't move sideways" well that is precisely what we want to avoid, moving sideways is basically moving without control.

Additionally, the wheels have a dual tread profile for both, smooth surfaces (glides effortlessly like rollerblades) or rugged surfaces (rolls outdoor on gravel or grass)

The Speedster and the Fastback has a two position ground clearance, another first in the industry. Thanks to the extremely low center of gravity, a rollover is physically impossible.

The Speedster has a soft comfortable ergonomic Polyurethane reinforced Uni-body shell with side-by-side convenient tool trays resistant to chemicals.

The FastBack is a Heavy-Duty blow molding HDPE shell that is practically indestructible. The ergonomic shape is very comfortable, and it does have a soft comfortable Polyurethane headrest.

While the Speedster and the FastBack design seems higher than a regular creeper, the backrest portion is as low as any other type of creeper. No need to raise the vehicle higher.

The Speedster and the FastBack are both available only on-line at: www.creepex.com
